🔗 2026-09-30 Release of logback version 1.6.5

• Fixed a vulnerability CVE-2026-104721 closely related to previously published CVE-2026-19880. The fix in version 1.6.3, which strips forward and backward slashes from MDC values, was insufficient. An MDC value could still contain relative path components such as `..`, variable references such as `/`, or characters that are special in file name patterns and email addresses. This latest vulnerability was found and reported by François Martin (GitHub: @martinfrancois, https://github.com/martinfrancois).

`MDCBasedDiscriminator`, used by `SiftingAppender`, now rejects MDC values instead of stripping characters from them. An MDC value is rejected if it is empty, if it is longer than 64 characters, if it contains the sequence `..`, or if it contains any of the following characters: `/ \ $ { } [ ] ( ) | ? * + % , @`. When an MDC value is rejected, the discriminator returns the value of its `DefaultValue` property. A warning is emitted for each rejected value. These warnings are rate-limited.

Andrej Karpathy
@karpathy

There's a new kind of coding I call "vibe coding" where you fully give in to the vibes, embrace exponentials, and forget that the code even exists. It's possible because the LLMs (e.g. Cursor Composer w Sonnet) are getting too good. Also I just talk to Composer with SuperWhisper so I barely even touch the keyboard. I ask for the dumbest things like "decrease the padding on the sidebar by half" because I'm too lazy to find it. I "Accept All" always, I don't read the diffs anymore. When I get error messages I just copy paste them in with no comment, usually that fixes it. The code grows beyond my usual comprehension, I'd have to really read through it for a while. Sometimes the LLMs can't fix a bug so I just work around it or ask for random changes until it goes away. It's not too bad for throwaway weekend projects, but still quite amusing. I'm building a project or webapp, but it's not really coding - I just see stuff, say stuff, run stuff, and copy paste stuff, and it mostly works.

1. Responsive Design

1. Responsive Design

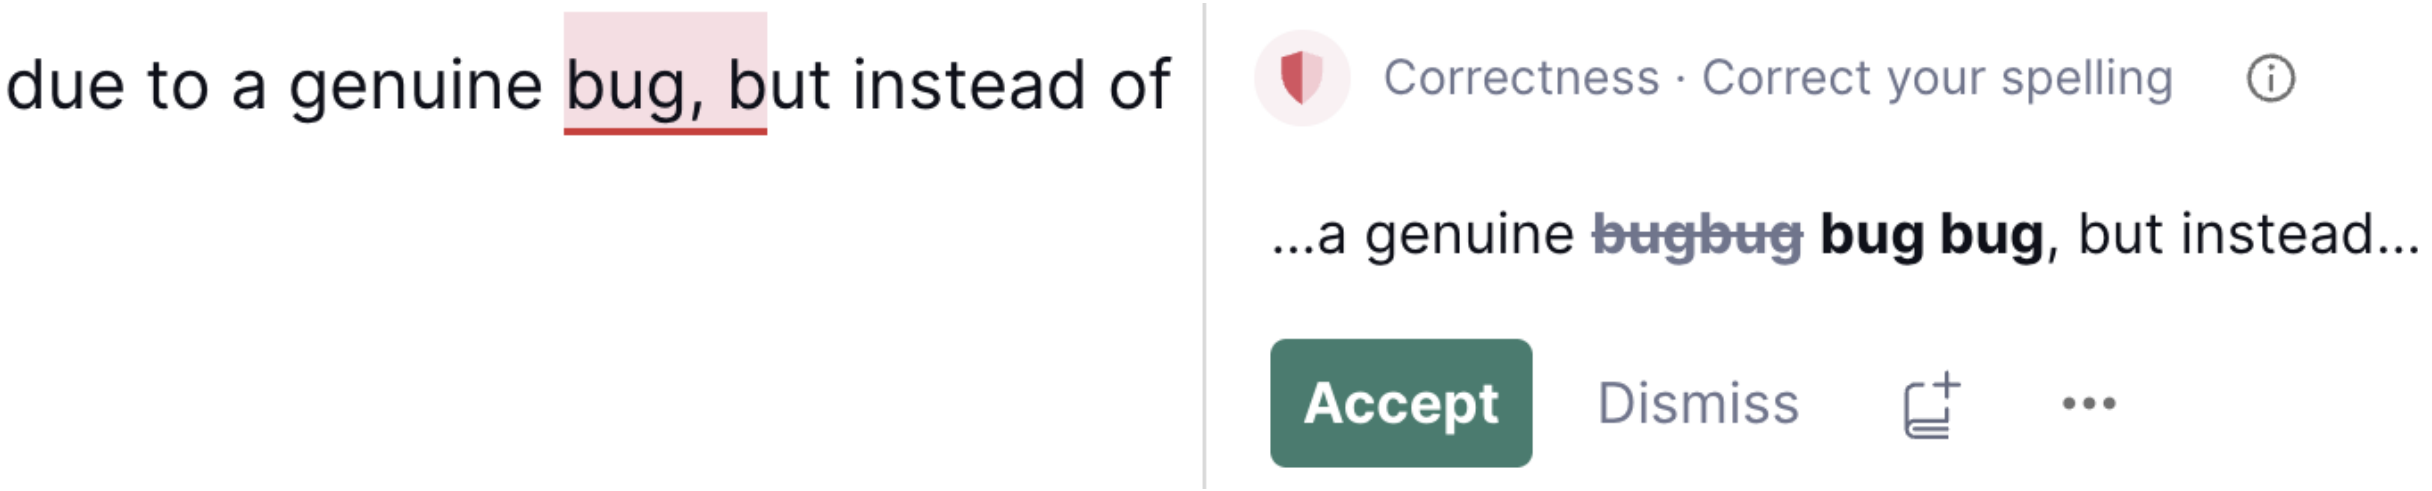

Bug: Context menu is cut off

- Mobile-first design
- End-to-end testing on mobile devices
  - Use frameworks like WebdriverIO to test on simulators/emulators and real devices
  - Alternatively, Playwright offers emulation (not as good)

2. Glitching

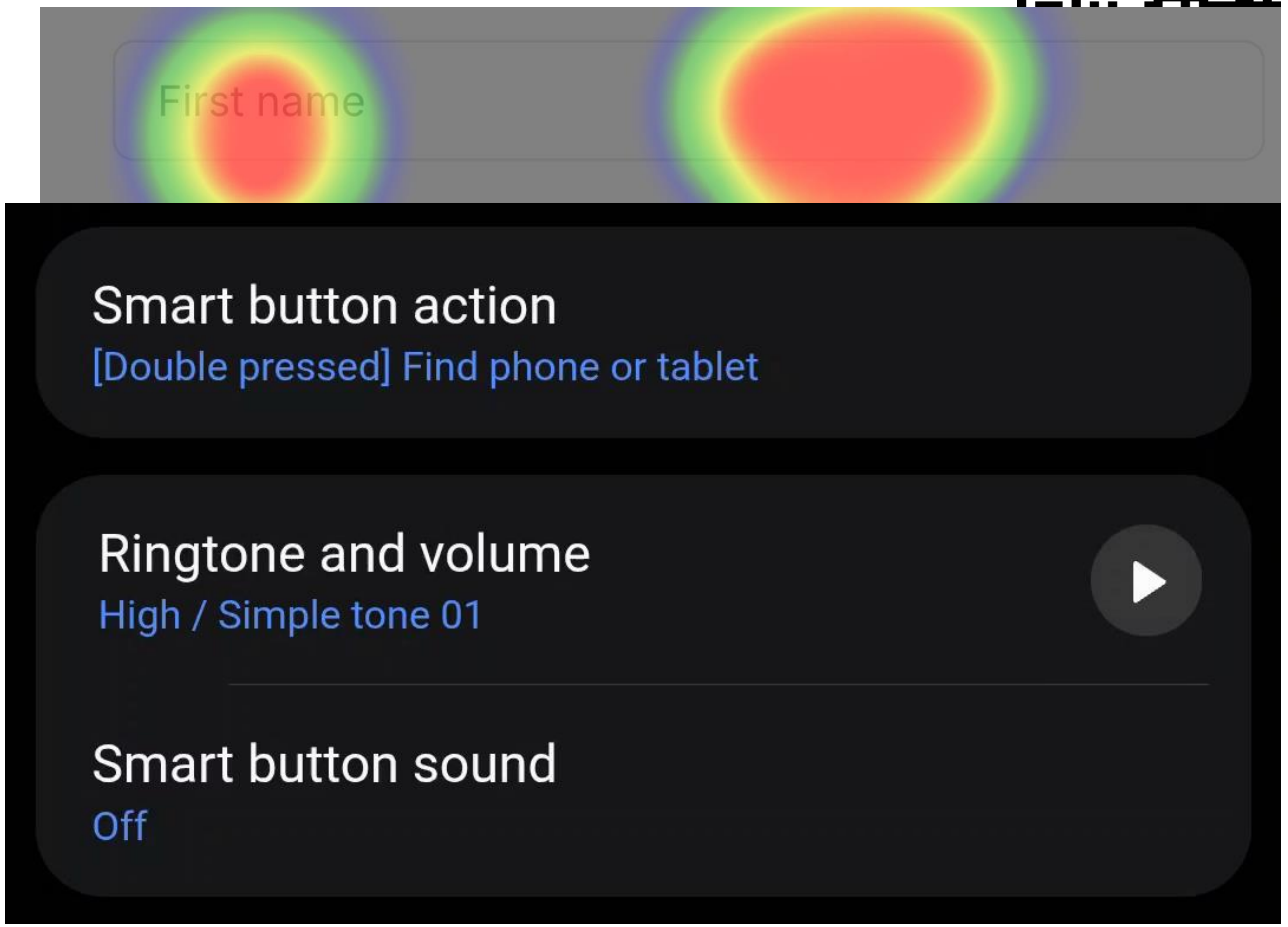

- End-to-end testing
- “Dogfooding”
- Exploratory Testing

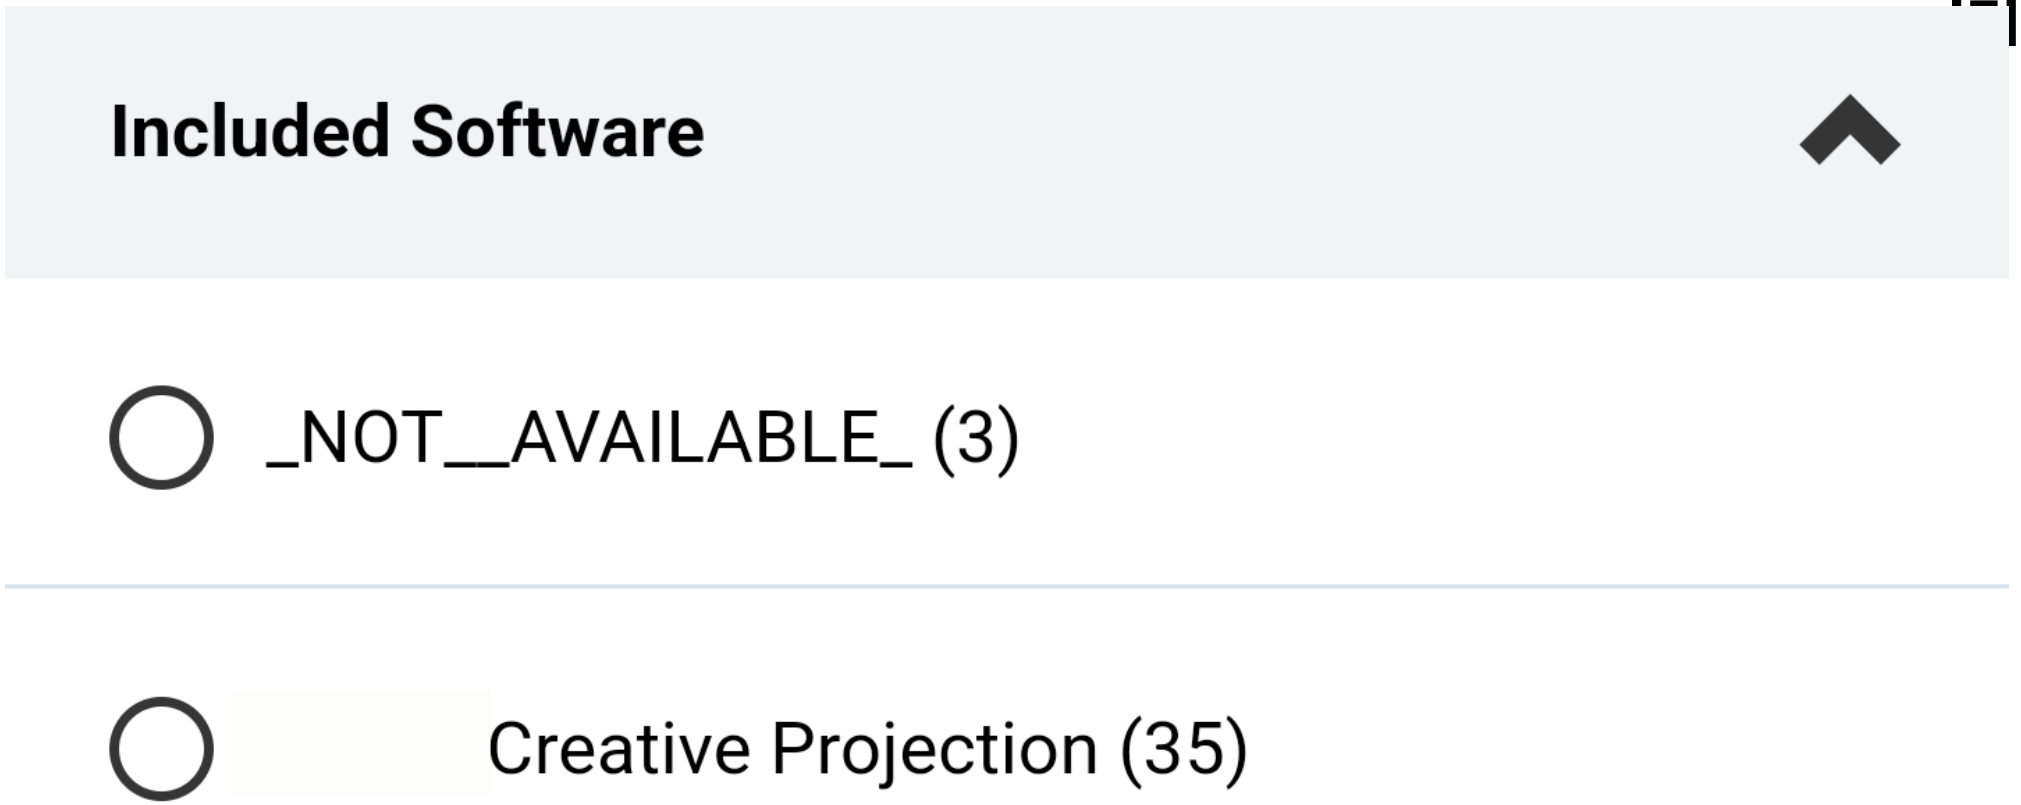

2. Glitching

Heatmap Visualization

- “Dead clicks”
  - Click on element, nothing happens
- “Rage clicks”
  - Repeated clicks out of frustration
  - Point of friction
  - Broken element
- Open Source Tool: Posthog

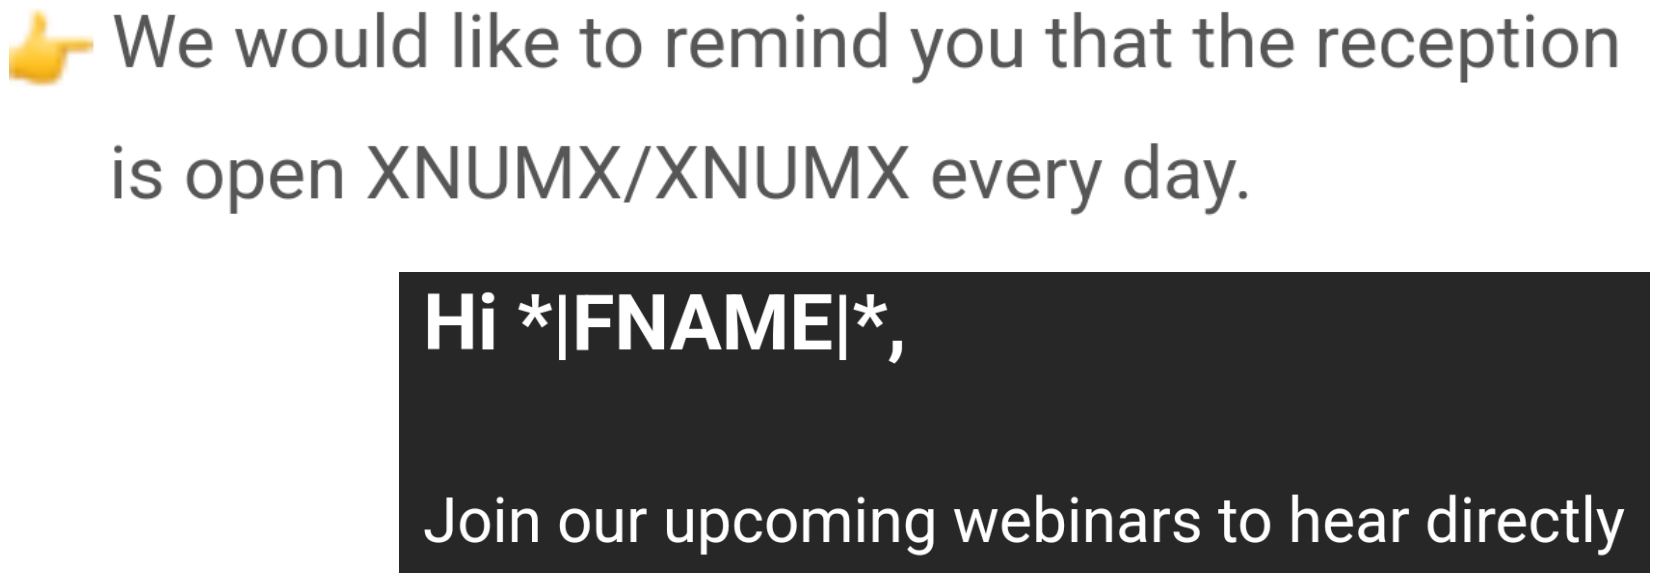

3. Unresolved templating

3. Unresolved templating

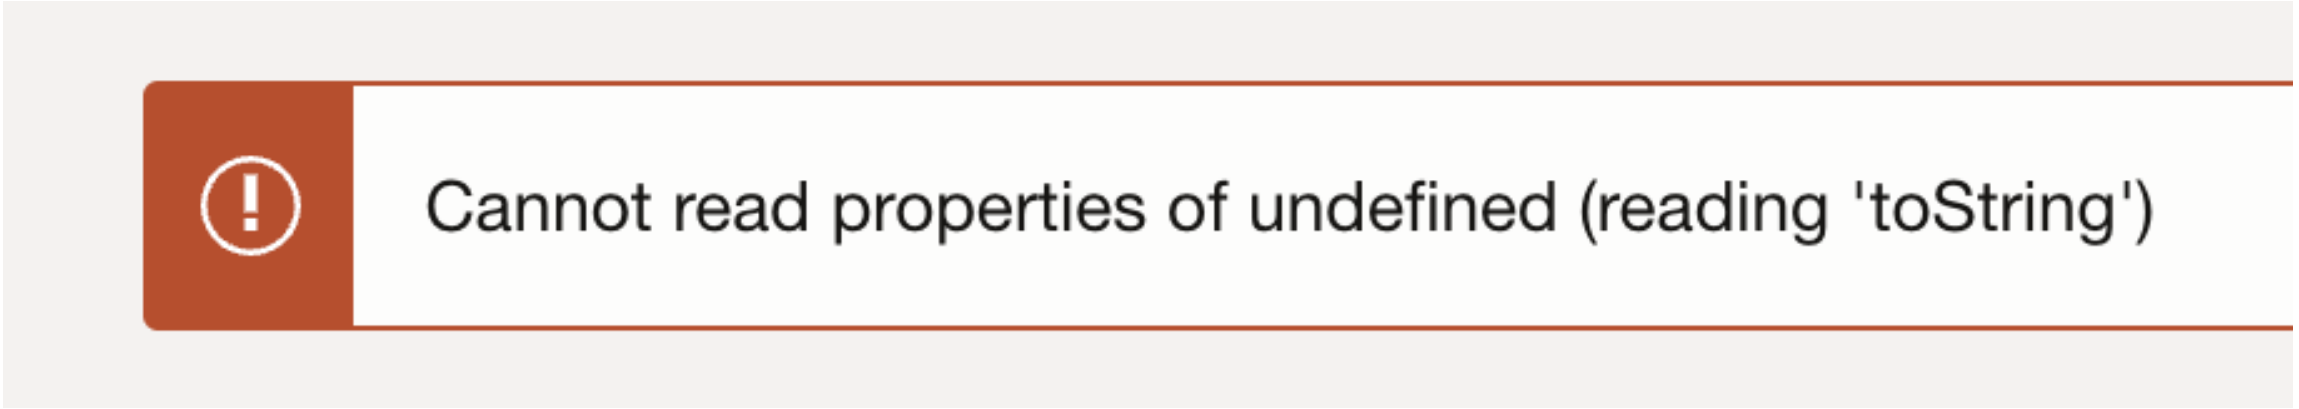

Bug: Placeholders not replaced

- Unit-/Integration testing
  - Test email templates, assert all placeholders missing
- Test edge cases:
  - No value
  - Very long value
  - UTF-8 characters

4. Unfiltered error message

Application error: a client-side exception has occurred (see the browser console for more information).

4. Unfiltered error message

Bug: Error message shown to user is generated from library/framework used

- Can be security or usability issue
- Turn off stack traces in the UI in production
- In production, only show explicit errors returned from backend
  - Otherwise show generic error message
    “An unexpected error occurred, please try again later or contact … if the issue persists.”
- Add alerting for errors from frontend and backend

Server Error in '/_mvc' Application.

Response is not available in this context.

Exception Details: System.Web.HttpException: Response is not available in this context.

Stack Trace:

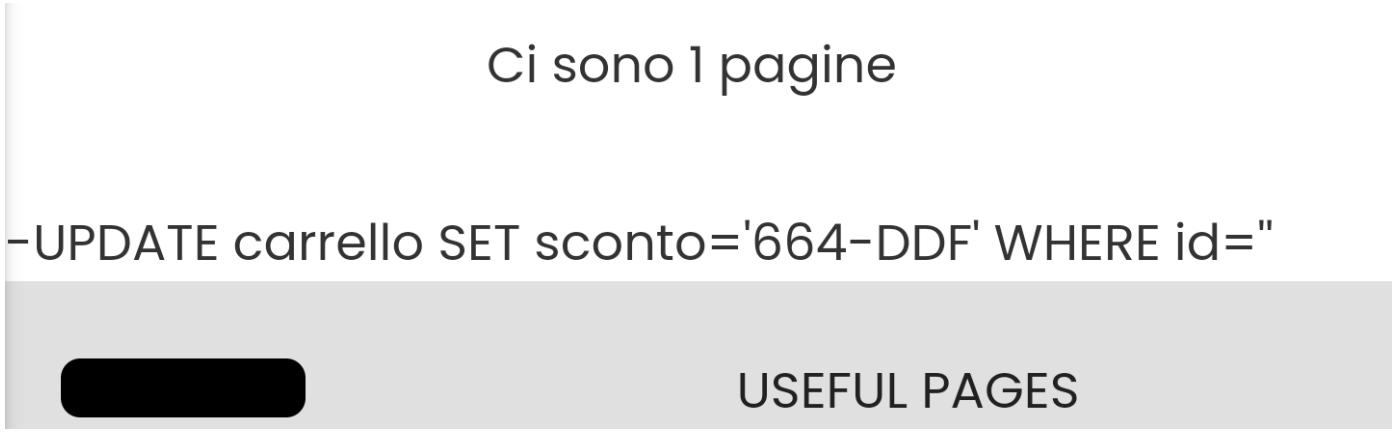

```
[HttpException (0x80004005):
Response is not available in
this context.]
System.Web.HttpContext.get_Resp
onse() +11822135
[redacted].Web.MvcApplication.Appl
ication_Start() in
C:\Users\WorkBox\Source\Workspa
ces\[redacted]\[redacted]\[redacted]\[redacted]
[redacted].Web\Global.asax.cs:47
```

The field Coupon must match the regular expression '^[a-zA-Z0-9_]{4,30}$'.

5. Unfiltered debug information

Bug: Debug information shown to users

- Turn off debug flags for production
  - If you must, use feature flags for specific users
- Prevent SQL injection and XSS

6. Incorrect/missing information

Bug: Incorrect information being shown

- Use four-eyes principle when entering data
- Add validations in case of data being significantly different from previous
- When fetching data from an API, especially in finance: perform plausibility checks
  - In case of unexpected data, alert and show old data with notice or display error message
